

IN THE CLAIMS:

1. (Currently Amended) A box in cardboard or a similar material for medicines or other products, said box comprising: including

~~a main compartment and an additional compartment - for an information sheet relative to the packaged product - separated with respect to said main compartment by a dividing wall,~~
5 ~~said box being defined by~~

four sections forming two opposite faces and two opposite sides; ~~and by~~

an appendage, said appendage glued to an ~~for gluing to the inside of one of [[the]]~~ said
sides forming a first compartment and a second compartment; ~~as well as and~~

two closing walls, ~~wherein:~~ one of [[the]] said two faces ~~presents~~ comprising an opening
10 defined by an incomplete cut line for securing at least a portion of the material covering the
opening, ~~which~~ said portion of material must be being removed to ~~allow the action of extracting~~
~~the~~ extract sheet-like contents [[of]] located within said ~~additional~~ first compartment, ~~to be~~
~~effected through said opening; and the~~ said glued appendage is shaped approximately like the
side to which it is glued and extends to form both [[the]] a dividing wall that is shaped like a
15 face and is internally adjacent to said face ~~equipped with~~ having an opening, and a successive
appendage ~~destined to be~~ positioned inside and against the other of said two sides;
~~characterized in that said additional component is~~ first compartment being devoid of a closing
wall and ~~presents~~ comprising an aperture ~~which is always~~ accessible for the extraction and
insertion of said information sheet independently of the opening or closing of said [[main]]
20 second compartment.

2. (Currently Amended) A box according to claim 1, ~~characterized in that~~ wherein one of said closing walls extends from ~~[[the]]~~ said dividing wall.

3. (Currently Amended) A box according to claim 1, ~~characterized in that~~ wherein one of said closing walls extends from the face opposite to the face equipped with the opening.

4. (Currently Amended) A box according to claim 1, ~~characterized in that~~ wherein the information sheet is repeatedly folded, stabilized in the folded position, and lightly glued to the cardboard material of the box.

5. (Currently Amended) A box according to claim 1, ~~characterized in that~~ wherein said information sheet is glued to said portion covering said opening, that must be removed to allow extraction of said sheet.

6. (Currently Amended) A box according to claim 1, ~~characterized in that~~ wherein said portion of material covering said opening is smaller than said opening.

7. (Currently Amended) A ~~procedure~~ method for the automated production of a box according to claim 1, the method comprising: ~~including the steps of~~
creating a dividing wall and ~~[[of]]~~ a contiguous appendage, ~~destined~~ to form a stabilizing

flap for said wall[[,]]; ~~characterized in that~~

5 folding [[the]] an information sheet ~~is folded~~;

~~stabilized~~ stabilizing said information sheet with a tear-off adhesive;

applying glue to the information sheet; and

10 feeding the information sheet ~~fed - after light gluing - during making of the box~~ for
gluing onto one of the walls of [[the]] an additional compartment[[,]] during [[the]] paper-
product machining processes.

8. (Currently Amended) A procedure according to claim 7, ~~characterized in that~~
wherein said dividing wall is formed as an extension of the flap ~~destined~~ to be glued for making
the body of the box.

9. (Currently Amended) A procedure according to claim 7, ~~characterized in that~~
wherein in the external face an opening is formed having a portion held on by anchoring
sections that can be torn to allow removal of said portion.

10. (Currently Amended) A procedure according to claim 9, ~~characterized in that~~
wherein the sheet is glued to the inside surface of said portion.

11. (New) A method for creating a box, the method comprising:

providing contiguous sections, said contiguous sections comprising an appendage;

folding said sections to form two opposite faces, two opposite sides and two closing walls, said faces, said sides and said closing walls defining a main compartment;

5 folding said appendage such that said appendage forms a dividing wall within said main compartment forming an additional compartment defined by said dividing wall and one of said faces, said additional compartment being devoid of a closing wall, said additional compartment comprising an aperture accessible for the extraction and insertion of information sheets independently of opening or closing of said main compartment;

10 gluing said appendage to an inside of one of said sides and to said two closing walls; and
 providing an opening in one of said faces defined by an incomplete cut line for securing at least a portion of material covering said opening, said portion of material being removed to extract contents within said additional compartment.
